

Topics in Continual Learning

It is hard to speak of something as being “AI” if the system concerned cannot learn from new inputs on the go. Unlike reinforcement learning, which studies agents learning to achieve an objective by learning about the environment, the continual (lifelong) learning effort hopes to design a framework for all machine learning models to admit learning from new examples after they have been deployed.

We have several topics available in the area including on benchmarking, elasticity, and plasticity research.

Candidate Profile. Generally speaking, a good candidate is a master’s student, well-versed in Python and with past experience in machine learning. An ideal candidate has trained neural networks before.
