

## Topics in Human-Computer Interaction and Social Computing

Are you excited about everything happened on the Internet everyday? Are you interested in any emerging applications or websites that help your daily lives? Do you have your own ideas of developing an application or other online services?

Human-computer interaction is an emerging field of study at present, due to the proliferation of large number of information systems. The key issue in this field is to make the system usable to audiences. In order to do that, we need to take care of the system design aspect (both software and hardware). Moreover, the field is interdisciplinary with inputs required from various other fields.

In general, for any interesting phenomenon observed by you, we would like to encourage you to analyze it systematically and from a user-centric perspective. We will guide you to analyze interesting online activities and explore the research questions during human-computer interaction.

**Requirements:** An interest in human-computer interaction. We will have weekly (online) meetings to address questions, discuss progress, and think about future ideas.

**Interested? Please contact us for more details!**
