

Ethical Issues in Scientific Research

Ethics is gaining importance in many researcher's professional lives. This is a welcome development since excellence in research depends crucially on good relations both to the scientific community and to society. On the other hand, the increasing diversification of academic ethics can at times be confusing.

In this project, we would to investigate how researchers address ethical issues in their studies, especially when they work with data.

Requirements: An interest in human-computer interaction. The student(s) should be able to work independently – this project may especially work well as a group project. We will have weekly meetings to address questions, discuss progress, and think about future ideas.
